理论生产率:
$$Q_T = \frac{43200}{60 \times 8} = 90$$
 (件/min)

转速: n=90 (r/min)

所以,运动循环:
$$T_P = \frac{60}{n} = \frac{2}{3}(s)$$

送料辊轮:

取送料时间 $T_{k1} = \frac{2}{13}s$,停歇时间 $T_{o1} = \frac{20}{39}s$

相应的分配轴转角:

$$\varphi_{k1} = 360^{\circ} \times \frac{T_{k1}}{T_P} = 83.1^{\circ}$$

$$\varphi_{o1} = 360^{\circ} \times \frac{T_{o1}}{T_P} = 276.9^{\circ}$$

剪刀:

取剪切工作行程时间: $T_{k8} = \frac{1}{26}s$

相应的分配轴转角:

$$\varphi_{k8} = 360^{\circ} \times \frac{T_{k8}}{T_{P}} = 20.8^{\circ}$$

取
$$T_{d8} = \frac{5}{156}s$$
,则 $T_{o8} = \frac{31}{52}s$

相应的分配轴转角:

$$\varphi_{d8} = 360^{\circ} \times \frac{T_{d8}}{T_P} = 17.3^{\circ}$$

$$\varphi_{o8} = 360^{\circ} \times \frac{T_{o8}}{T_P} = 321.9^{\circ}$$

顶糖杆:

取工作位置停留时间 $T_{a5} = \frac{1}{78}s$

$$arphi_{a5}=360^{\circ} imesrac{T_{a5}}{T_{P}}=6.9^{\circ}$$
 取 $T_{k5}=rac{3}{26}s$, $T_{d5}=rac{7}{78}s$,则 $T_{o5}=rac{35}{78}s$
$$arphi_{k5}=360^{\circ} imesrac{T_{k5}}{T_{P}}=62.3^{\circ}$$
 $arphi_{d5}=360^{\circ} imesrac{T_{d5}}{T_{P}}=48.5^{\circ}$ $arphi_{o5}=360^{\circ} imesrac{T_{o5}}{T_{P}}=242.3^{\circ}$

活动折纸板:

取工作行程时间 $T_{k6} = \frac{2}{39}s$

$$\begin{split} \varphi_{k6} &= 360^{\circ} \times \frac{T_{k6}}{T_{P}} = 27.7^{\circ} \\ \mathbb{R}T_{a6} &= \frac{1}{39}s, \ T_{d6} = \frac{35}{156}s, \ \mathbb{M}T_{o6} = \frac{19}{52}s \\ \varphi_{a6} &= 360^{\circ} \times \frac{T_{a6}}{T_{P}} = 13.8^{\circ} \\ \varphi_{d6} &= 360^{\circ} \times \frac{T_{d6}}{T_{P}} = 121.1^{\circ} \\ \varphi_{o6} &= 360^{\circ} \times \frac{T_{o6}}{T_{P}} = 197.3^{\circ} \end{split}$$

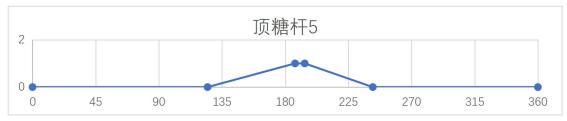

错移量取 $\Delta_t = \frac{1}{52}(s)$

$$\Delta_{\varphi} = 360^{\circ} \times \frac{\Delta_t}{T_P} = 10.4^{\circ}$$

得工作循环图:

因为活动折纸板回程与送料辊轮的送料过程和剪刀的工作互不干涉,所以活动折纸板的运动时间从 238.9°+10.4°=249.3°处开始到 360°处可以放在 0°到 110.7°处进行。

此时工作循环: $T'_P = \frac{249.3}{360} \times \frac{2}{3} = 0.46(s)$

分配轴转速: $n'_P = \frac{60}{T'_P} = 130(r/min)$

理论生产率: $Q'_P = 130$ (件/min)

修正后的工作循环图:
